

## Mayo Clinic Industry Standard Data Model Testimonial

Mayo Clinic, the world's largest research and patient-centered hospital organization, had embarked on the development of an enterprise data management program to organize research, patient and treatment data from all its sites to analyze results for various forms of cancer. To do this effectively, Mayo needed to understand its enterprise data architecture rapidly, and could not afford the luxury of building an enterprise data model on its own.

After having evaluated other enterprise data models, including those from Teradata, Oracle, IBM and other vendors, Mayo reviewed the healthcare enterprise data model from *EWSolutions*. The Enterprise Data Trust team determined that this model was robust, manageable, fully supportive of Mayo's needs and flexible.

Mayo Clinic selected the *EWSolutions*' Healthcare insurance enterprise data model.

"The quality of the product produced by *EWSolutions* is truly outstanding. The knowledge contained in the healthcare data model, both from the industry and the data architecture perspectives, is superb. In addition, the model was flexible and met the needs of Mayo without the need for expensive or long-term consultants. Having the use of this enterprise data model made our enterprise data architecture program proceed much faster than we would have been able to go without it."
